

DID YOU KNOW?

Battery energy storage systems (BESS) are not just reliable — they're **cyber secure**.

Modern BESS are built with cybersecurity at their core, unlike many older grid assets that were never designed for today's digital environment.

Texas requires stronger protections against foreign interference in critical infrastructure — including policies like the **Lone Star Infrastructure Protection Act**, which prohibits private businesses from entering into contracts with companies linked to adversarial nations that would grant them direct or indirect access to critical infrastructure.

Leading storage providers also comply with rigorous standards like **NERC CIP**, ensuring every layer of hardware and software is monitored, traceable & protected from cyber threats.
